

The GAMS logo, consisting of the word "GAMS" in bold black letters on a white rectangular background, which is positioned above two solid black squares.

GAMS

An Introduction

Frederik Fiand & Tim Johannessen

GAMS Software GmbH

Agenda

GAMS at a Glance

GAMS - Hands On Examples

APIs - Application Programming Interfaces to GAMS

Outlook - Some Advanced GAMS Features

Company

- Roots: World Bank, 1976
- Went commercial in 1987
- Locations
 - GAMS Development Corporation (Washington)
 - GAMS Software GmbH (Germany)
- Product: The **General Algebraic Modeling System**

What did this give us?

Simplified model development & maintenance

Increased productivity tremendously

Made mathematical optimization available to a broader audience (domain experts)

➤ 2012 INFORMS Impact Prize

Broad User **Community and Network**

11,500+ licenses

Users: 50% academic, 50% commercial

GAMS used in more than 120 countries

Uniform interface to more than 30 solvers

25+ Years
GAMS Development

Broad Range of **Application Areas**

Agricultural Economics	Applied General Equilibrium
Chemical Engineering	Economic Development
Econometrics	Energy
Environmental Economics	Engineering
Finance	Forestry
International Trade	Logistics
Macro Economics	Military
Management Science/OR	Mathematics
Micro Economics	Physics

25+ Years
GAMS Development

Foundation of GAMS

Powerful algebraic modeling language

Open architecture and interfaces to other systems, independent layers

Powerful Declarative Language

Similar to mathematical notation

Easy to learn - few basic language elements: sets, parameters, variables, equations, models

Model is executable (algebraic) description of the problem

Mix of Declarative and Imperative Elements

Control Flow Statements (e.g. loops, for, if,...), macros and functions

Advantages:

- Build complex problem algorithms within GAMS
- Simplified interaction with other systems:
 - Data exchange
 - GAMS process control

- Project management
- Editor / Syntax coloring / Spell checks
- Tree view / Syntax-error navigation
- Model Debugging & Profiling
- Solver selection & setup
- Data viewer
 - Export
 - Charting
- GAMS Processes Control

Independence of **Model** and **Operating System**

Platforms supported by GAMS:

➔ **Models can be moved between platforms with ease!**

Independence of **Model and Solver**

One environment for a wide range of model types and solvers

All major commercial
LP/MIP solver

Open Source Solver (COIN)

Also solver for NLP, MINLP,
global, and stochastic
optimization

➔ Switching between solvers with one line of code!

Independence of Model and Data

- Declarative Modeling
- ASCII: Initial model development
- GDX: Data layer (“contract”) between GAMS and applications
 - Platform independent
 - No license required
 - Direct GDX interfaces and general API
 - ...

Independence of **Model and User Interface**

API's

- *Low Level*
- **Object Oriented:** .Net, Java, Python
- No modeling capability: Model is written in GAMS
- Wrapper class that encapsulates a GAMS model

Smart Links to other Applications

- User keeps working in his productive tool environment
- Application accesses all optimization capabilities of GAMS through API
- Visualization and analysis of model data and results in the application

MS Excel

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O

loc <- cmdscale(e
rx <- range(x <-
ry <- range(y <-
tspres <- loc[sol
s <- seq(n)
```

Model

Platform

Solver

Data

Interface

Striving for **Innovation** and **Compatibility**

Models must benefit from:

Advancing hardware / New Platforms

Enhanced / new solver and solution technology

Improved / upcoming interfaces to other systems

New Modeling Concepts

Protect investments of Users

Life time of a model: 15+ years

New maintainer, platform, solver, user interface

Backward Compatibility

Software Quality Assurance

Free Model Libraries

Model Libraries Help

- GAMS Model Library
- GAMS Test Library
- GAMS Data Utilities Models
- GAMS EMP Library
- GAMS API Library
- Practical Financial Optimization Models
- Nonlinear Optimization Applications (N. Andrei)

➤ More than 1400 models!

Why GAMS?

- Experience of 25+ years
- Broad user community from different areas
- Lots of model templates
- Strong development interface
- Consistent implementation of design principles
 - Simple, but powerful modeling language
 - Independent layers
 - Open architecture: Designed to interact with other applications
- Open for new developments
- Protecting investments of users

Agenda

GAMS at a Glance

GAMS - Hands On Examples

APIs - Application Programming Interfaces to GAMS

Outlook - Some Advanced GAMS Features

A Simple **Transportation Problem**

What does this example show?

It gives a first glimpse of how a problem can be formulated in GAMS

It shows some basics of data exchange with GAMS

It shows how easy it is to change model type and, consequently, solver technology

Model types **in this example**

LP

- Determine minimum transportation cost.
Result: city to city shipment volumes.

MIP

- Allows discrete decisions,
e.g. if we ship, then we ship at least 100 cases.

MINLP

- Allows non-linearity,
e.g. a smooth decrease in unit cost when
shipping volumes grows

SP

- Allows uncertainty,
e.g. uncertain demand

Model types **in this example**

LP

- Determine minimum transportation cost.
Result: city to city shipment volumes.

MIP

- Allows discrete decisions,
e.g. if we ship, then we ship at least 100 cases.

MINLP

- Allows non-linearity,
e.g. a smooth decrease in unit cost when
shipping volumes grows

SP

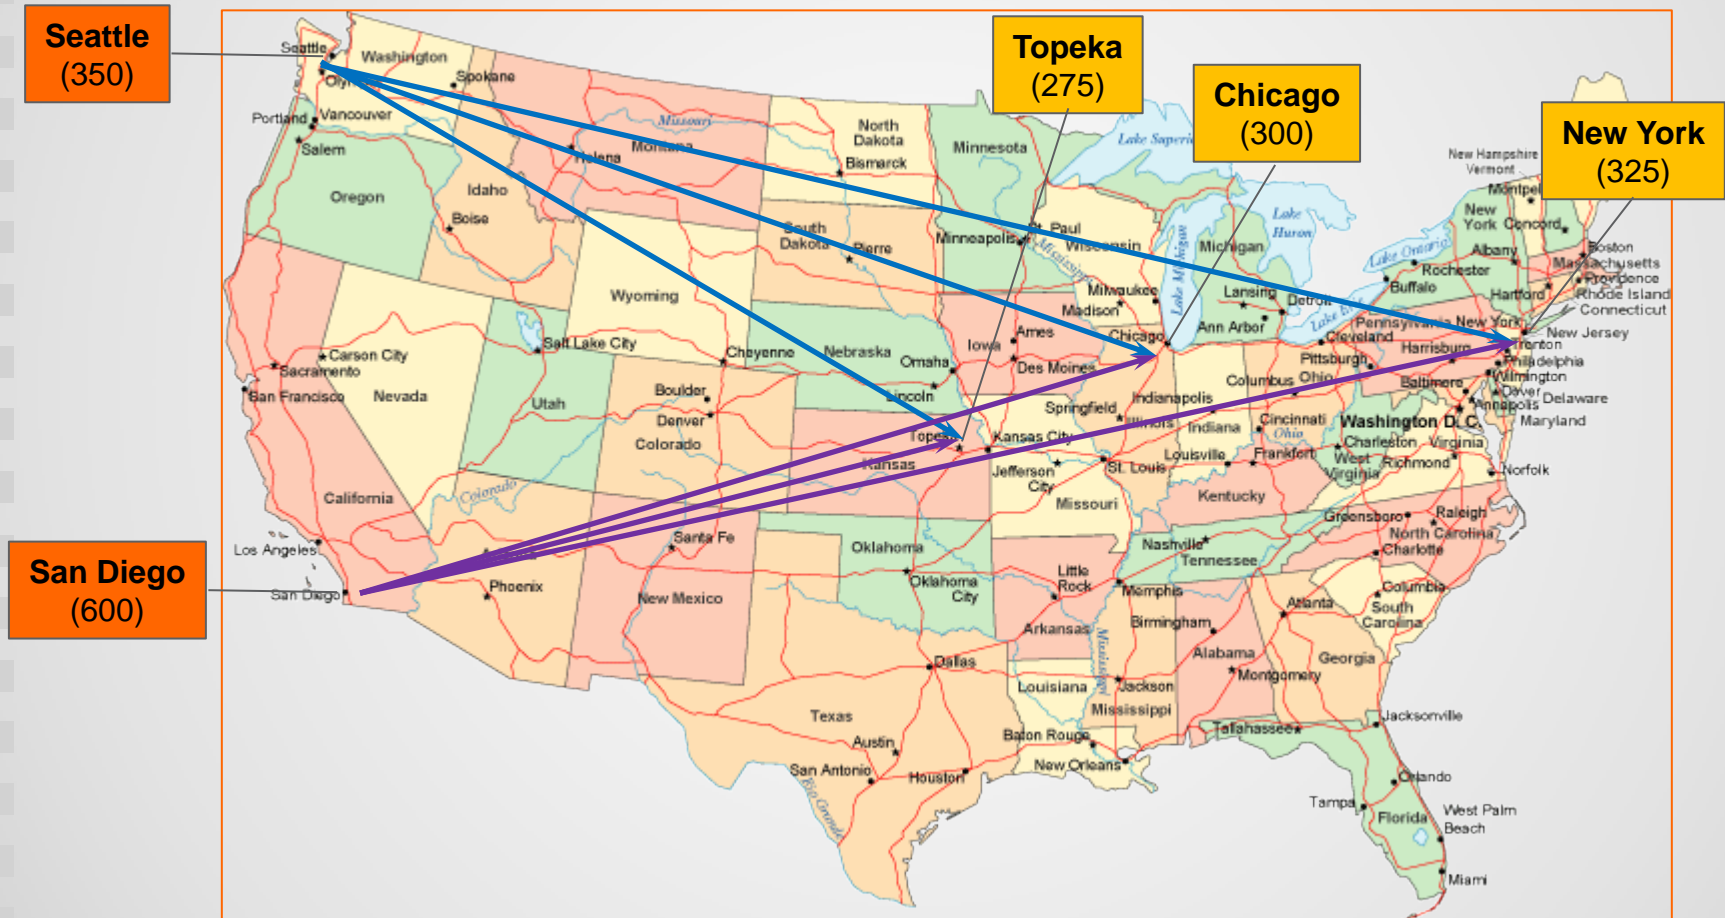

- Allows uncertainty,
e.g. uncertain demand

A Simple **Transportation Problem**

Canning Plants (supply)

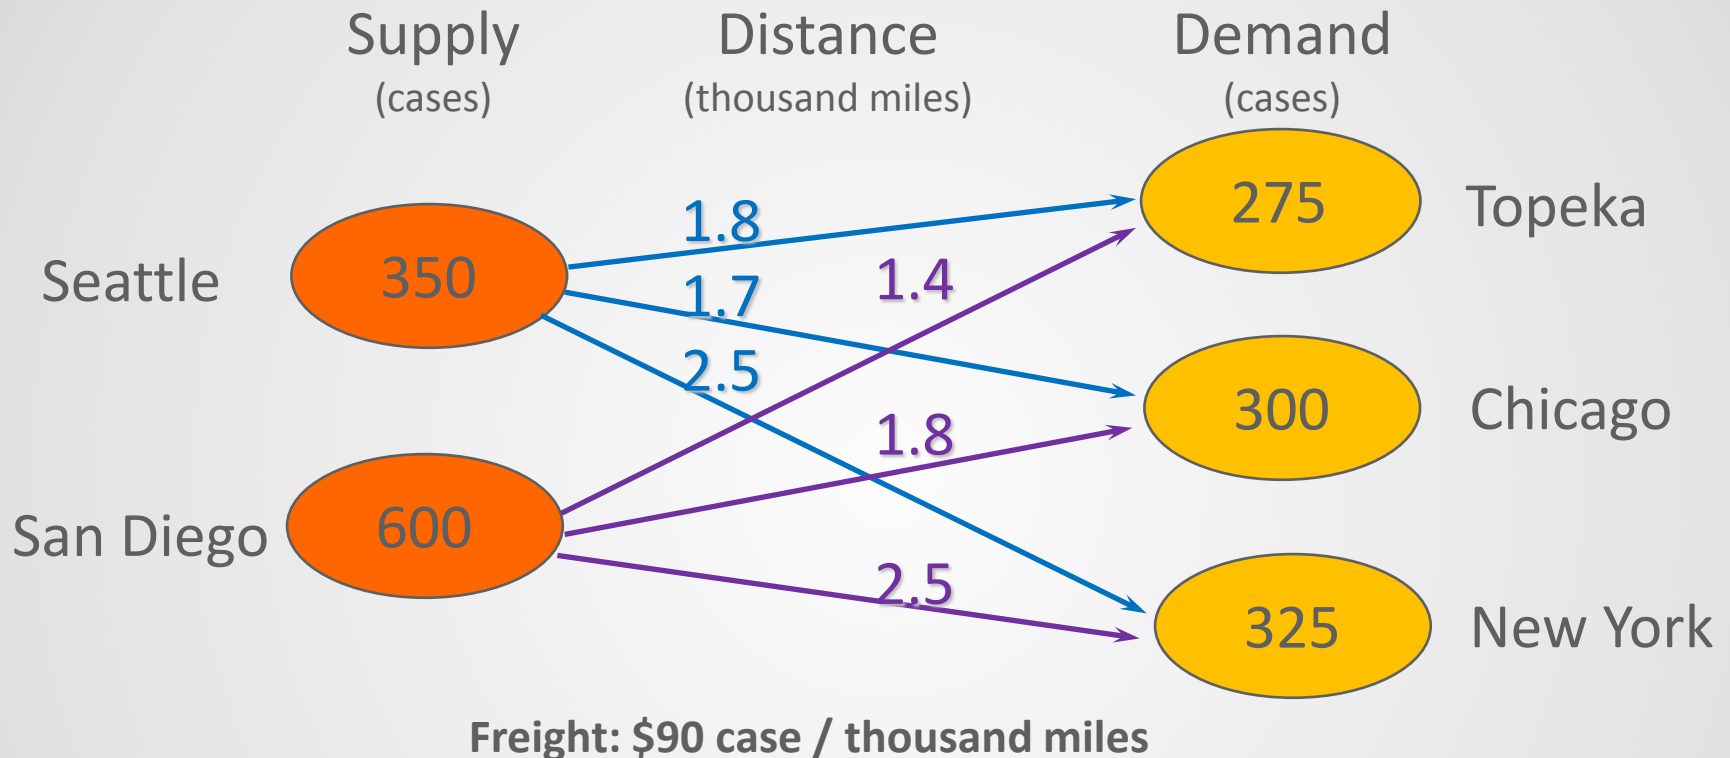

shipments

(Number of cases)

Markets (demand)

Freight: \$90 case / thousand miles

A Simple **Transportation Problem**

Minimize
subject to
Transportation cost
Demand satisfaction at markets
Supply constraints

Mathematical Model Formulation

Indices: i (Canning plants)
 j (Markets)
 Decision variables: x_{ij} (Number of cases to ship)
 Data: c_{ij} (Transport cost per case)
 a_i (Capacity in cases)
 b_j (Demand in cases)

min $\sum_i \sum_j c_{ij} \cdot x_{ij}$ (Minimize total transportation cost)

subject to

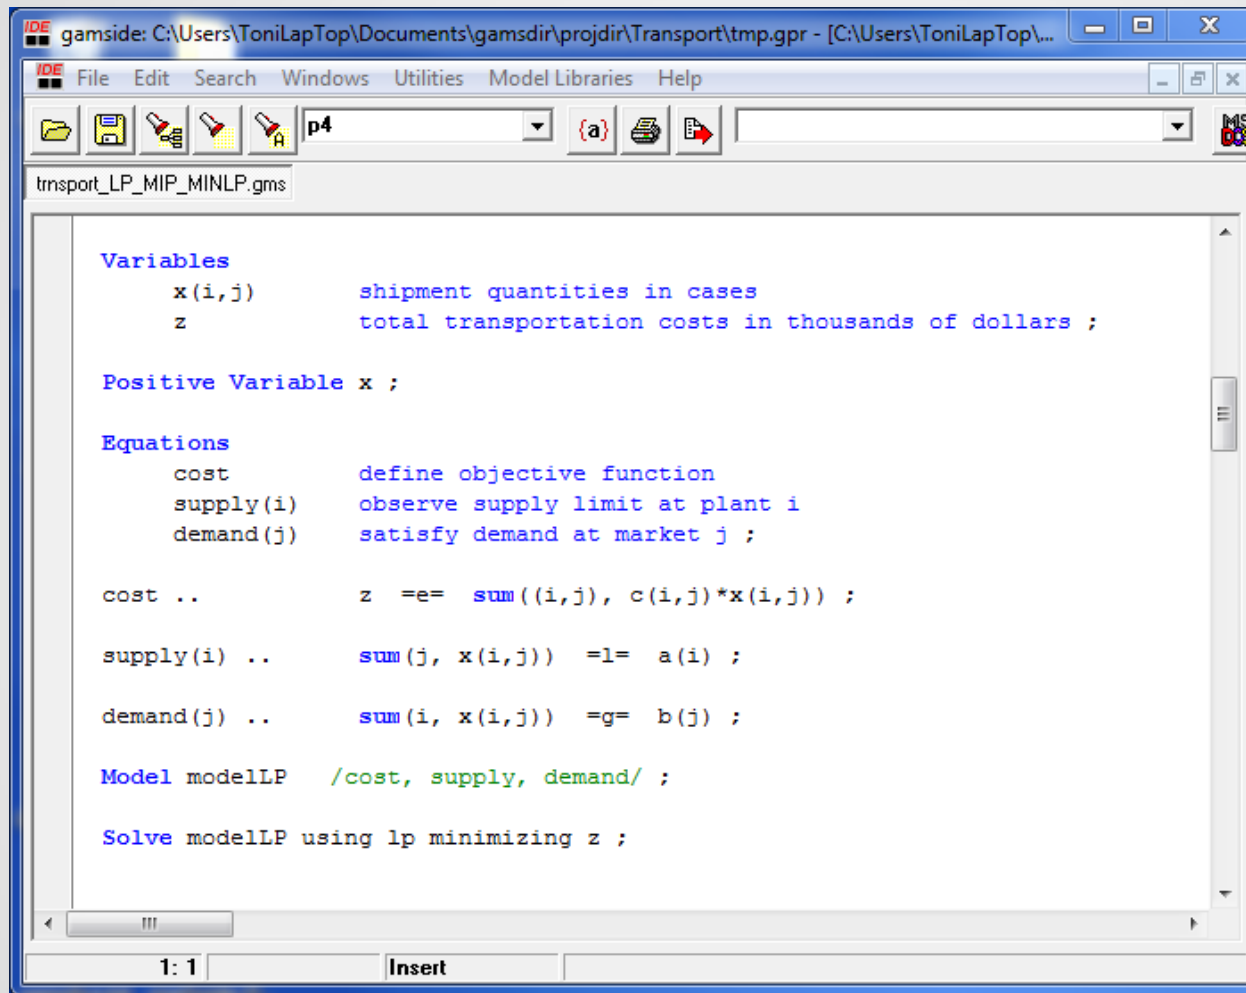

$\sum_j x_{ij} \leq a_i \quad \forall i$ (Shipments from each plant \leq supply capacity)

$\sum_i x_{ij} \geq b_j \quad \forall j$ (Shipments to each market \geq demand)

$x_{ij} \geq 0 \quad \forall i, j$ (Do not ship from market to plant)

$i, j \in \mathbb{N}$

GAMS Syntax (LP Model)

The screenshot shows the GAMS IDE window titled 'gamside: C:\Users\ToniLapTop\Documents\gamsdir\projdir\Transport\tmp.gpr - [C:\Users\ToniLapTop\...'. The menu bar includes File, Edit, Search, Windows, Utilities, Model Libraries, and Help. The toolbar contains icons for file operations and a dropdown menu showing 'p4'. The main text area displays the GAMS code for a transport model, with the filename 'transport_LP_MIP_MINLP.gms' shown in the title bar of the editor window.

```
Variables
    x(i,j)      shipment quantities in cases
    z            total transportation costs in thousands of dollars ;

Positive Variable x ;

Equations
    cost         define objective function
    supply(i)    observe supply limit at plant i
    demand(j)    satisfy demand at market j ;

cost ..         z =e= sum((i,j), c(i,j)*x(i,j)) ;

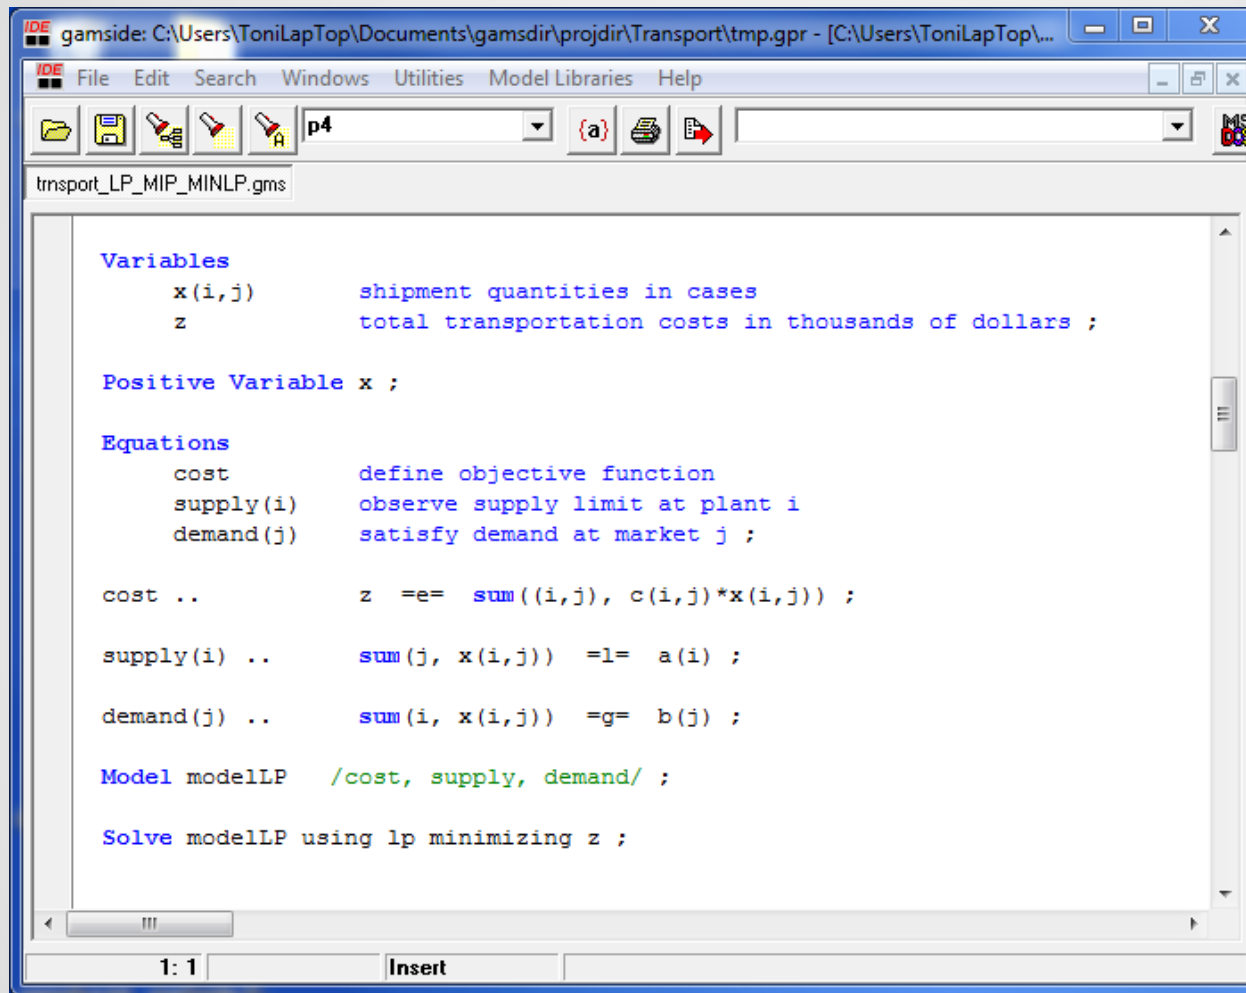

supply(i) ..    sum(j, x(i,j)) =l= a(i) ;

demand(j) ..    sum(i, x(i,j)) =g= b(j) ;

Model modelLP   /cost, supply, demand/ ;

Solve modelLP using lp minimizing z ;
```

GAMS Syntax (LP Model)

The screenshot shows the GAMS IDE window titled "gamside: C:\Users\ToniLapTop\Documents\gamsdir\projdir\Transport\tmp.gpr - [C:\Users\ToniLapTop\...". The menu bar includes File, Edit, Search, Windows, Utilities, Model Libraries, and Help. The toolbar contains icons for file operations and a dropdown menu showing "p4". The main text area displays the GAMS code for a transport model, with the filename "transport_LP_MIP_MINLP.gms" shown in the title bar of the editor window.

```
Variables
    x(i,j)      shipment quantities in cases
    z            total transportation costs in thousands of dollars ;

Positive Variable x ;

Equations
    cost         define objective function
    supply(i)    observe supply limit at plant i
    demand(j)    satisfy demand at market j ;

cost ..         z =e= sum((i,j), c(i,j)*x(i,j)) ;

supply(i) ..    sum(j, x(i,j)) =l= a(i) ;

demand(j) ..    sum(i, x(i,j)) =g= b(j) ;

Model modelLP   /cost, supply, demand/ ;

Solve modelLP using lp minimizing z ;

  demand(j) satisfy demand at market j ;
```

GAMS **Syntax** (Data Input)

The screenshot shows the GAMS IDE interface. The top menu bar includes File, Edit, Search, Windows, Utilities, Model Libraries, and Help. The toolbar contains icons for file operations and a dropdown menu set to 'optfile'. The main window displays a GAMS script for data input, with the title bar indicating the file path: C:\Users\Fred\Documents\talks\2016-09-OR2016\Preconference Workshop\demo\3_trnsport_gdx.gms. The script is organized into sections: Sets, Parameters, Equations, and Variables. The Sets section defines 'i' as 'canning plants' and 'j' as 'markets'. The Parameters section defines 'a(i)' as 'capacity of plant i in cases', 'b(j)' as 'demand at market j in cases', 'd(i,j)' as 'distance in thousands of miles', and 'c(i,j)' as 'transport cost in thousands of dollars per case'. The Equations section defines 'cost' as 'define objective function', 'supply(i)' as 'observe supply limit at plant i', and 'demand(j)' as 'satisfy demand at market j'. The Variables section defines 'x(i,j)' as 'shipment quantities in cases' and 'z' as 'total transportation costs in thousands of dollars'. The script also includes a scalar 'f' for 'freight in dollars per case per thousand miles' and a calculation for 'c(i,j)' based on 'f' and 'd(i,j)'. The script is saved as 'data.gms'.

Solution to LP model

Canning Plants (supply)

shipments

(Number of cases)

Markets (demand)

Freight: \$90 case / thousand miles

Total cost: \$153,675

Model types **in this example**

LP

- Determine minimum transportation cost.
Result: city to city shipment volumes.

MIP

- Allows discrete decisions,
e.g. if we ship, then we ship at least 100 cases.

MINLP

- Allows non-linearity,
e.g. a smooth decrease in unit cost when
shipping volumes grows

SP

- Allows uncertainty,
e.g. uncertain demand

Model types **in this example**

MIP Model: Minimum Shipment of 100 cases

- Shipment volume: x (continuous variable)
- Discrete decision: **ship** (binary variable)

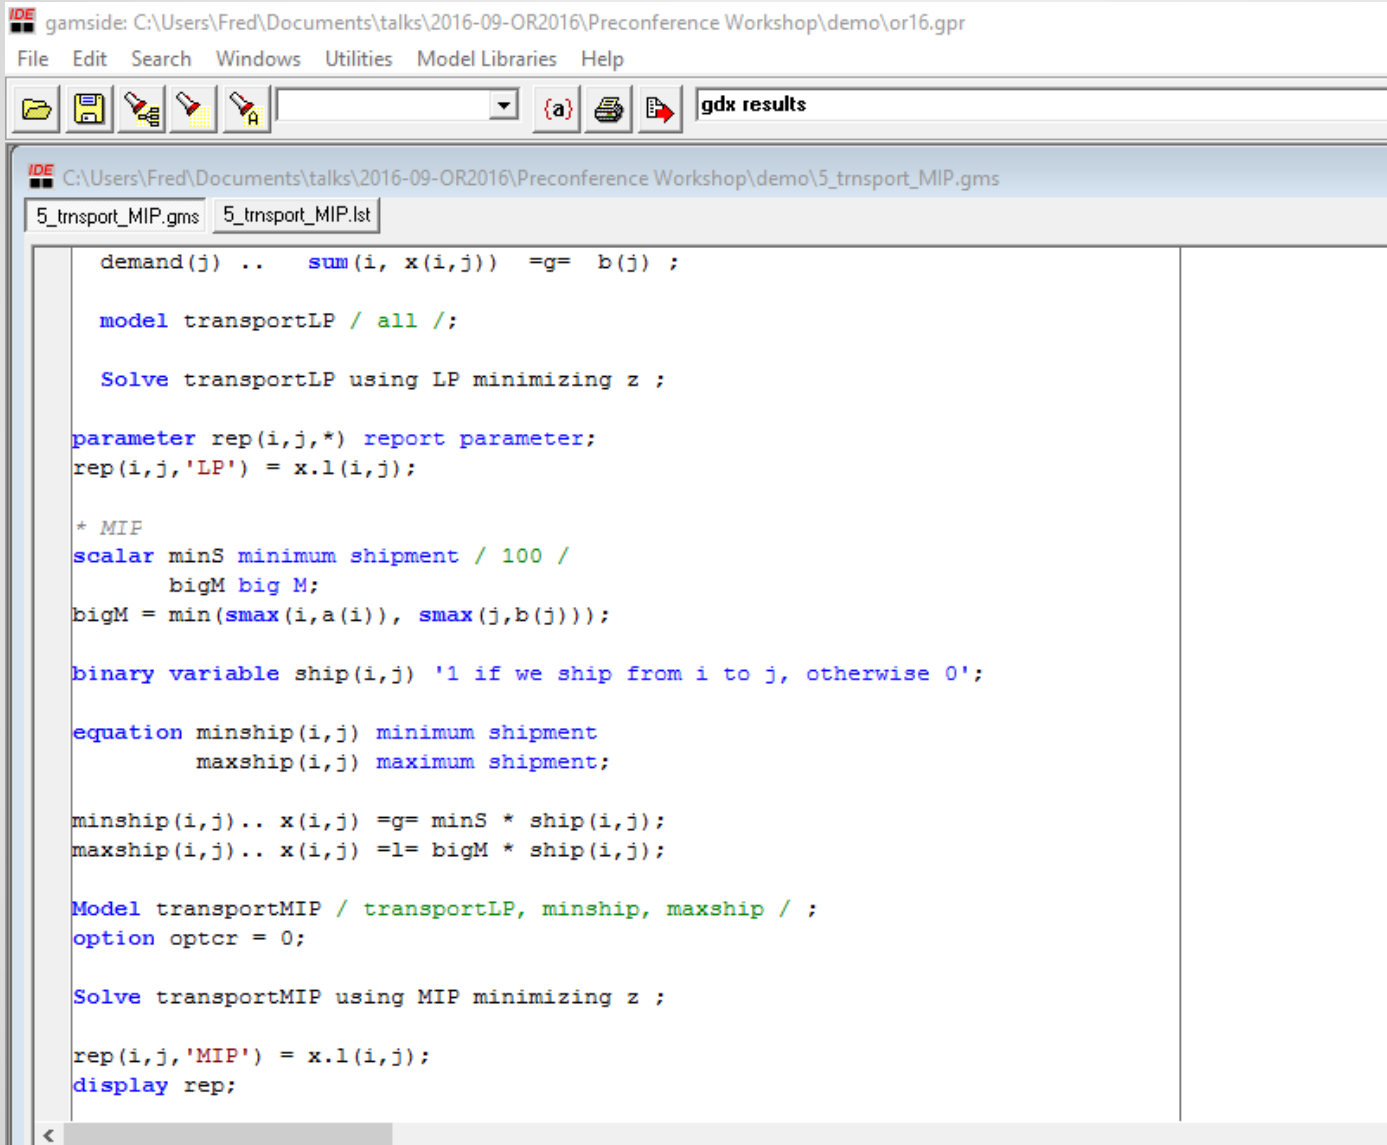

add constraints:

$$x_{i,j} \geq 100 \cdot \text{ship}_{i,j} \quad \forall i,j \quad (\text{if ship}=1, \text{ then ship at least 100})$$

$$x_{i,j} \leq \text{bigM} \cdot \text{ship}_{i,j} \quad \forall i,j \quad (\text{if ship}=0, \text{ then do not ship at all})$$

$$\text{ship}_{i,j} \in \{0,1\}$$

MIP Model: GAMS Syntax

MINLP Model: **Solution**

Canning Plants (supply)

shipments

(Number of cases)

Markets (demand)

Freight: \$90 case / thousand miles

Total cost: \$153,675

Model types **in this example**

Model types **in this example**

LP

- Determine minimum transportation cost.
Result: city to city shipment volumes.

MIP

- Allows discrete decisions,
e.g. if we ship, then we ship at least 100 cases.

MINLP

- Allows non-linearity,
e.g. a smooth decrease in unit cost when
shipping volumes grows

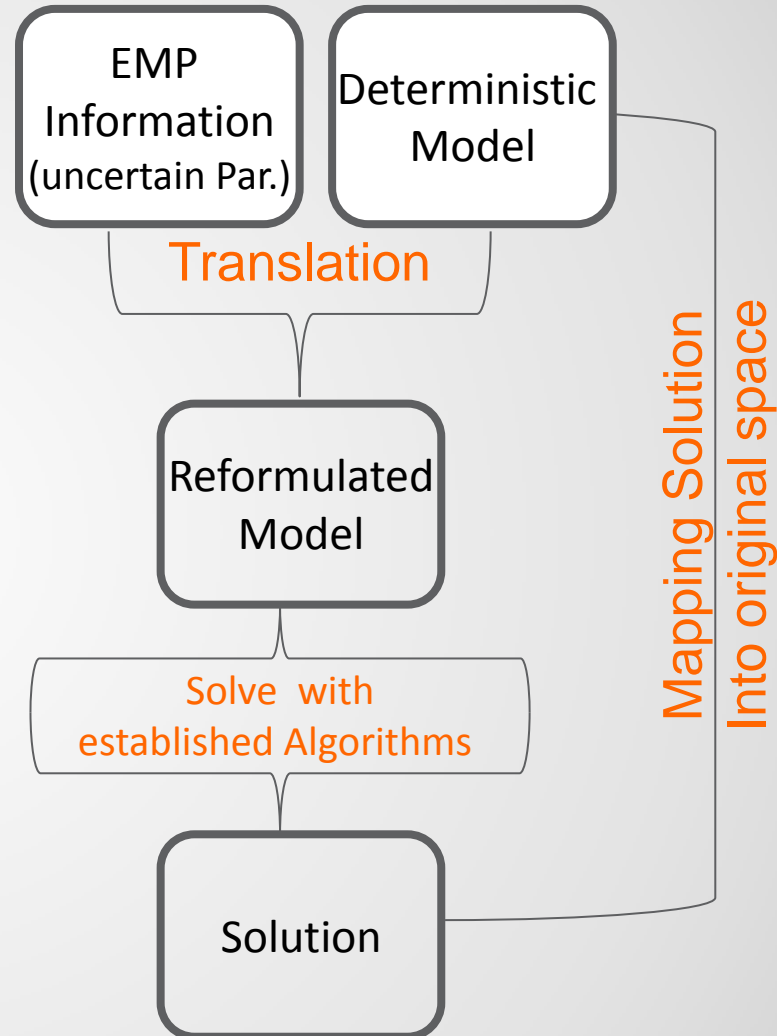

SP

- Allows uncertainty,
e.g. uncertain demand

Stochastic Programming in GAMS

EMP/SP

- Simple interface to add uncertainty to existing deterministic models
- (EMP) Keywords to describe uncertainty include: discrete and parametric random variables, stages, chance constraints, Value at Risk, ...
- Available solution methods:
 - Automatic generation of Deterministic Equivalent (can be solved with any solver)
 - Specialized commercial algorithms (DECIS, LINDO)

Transport Example - Uncertain Demand

b(j): demand at market j in cases	
new-york	325
chicago	300
topeka	275

Uncertain
demand factor bf

Decisions to make

- First-stage decision: How many units should be shipped “here and now” (without knowing the outcome)
- Second-stage (recourse) decision:
 - How can the model react if we do not ship enough?
 - Penalties for “bad” first-stage decisions, e.g. buy additional cases $u(j)$ at the demand location:

```

costsp .. z =e= sum((i,j), c(i,j)*x(i,j)) +
sum(j, 0.3*u(j));
demandsp(j) .. sum(i, x(i,j)) =g= bf*b(j) - u(j) ;
  
```

Uncertain Demand - GAMS Algebra

Stochastic Programming in GAMS

- The Extended Mathematical Programming (EMP) framework is used to replace parameters in the model by random variables
- Support for Multi-stage recourse problems and chance constraint models
- Easy to add uncertainty to existing deterministic models, to either use specialized algorithms or create Deterministic Equivalent (new free solver DE)
- More information:
<http://www.gams.com/dd/docs/solvers/empsp.pdf>

Agenda

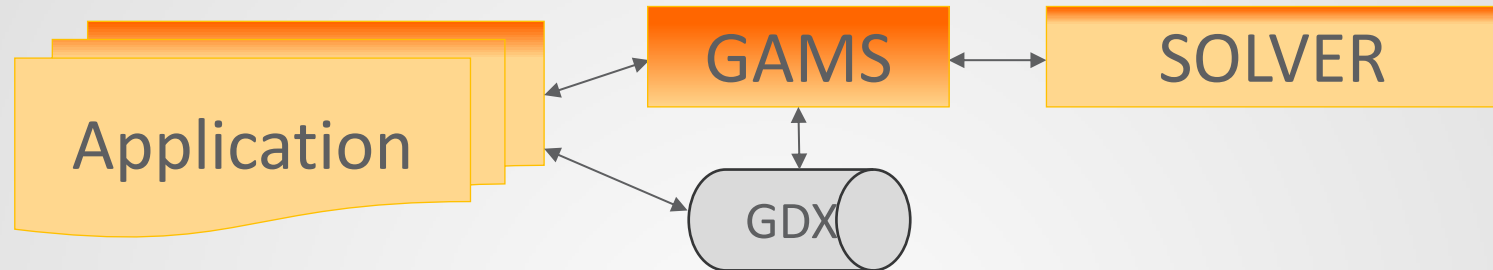

GAMS at a Glance

GAMS - Hands On Examples

APIs - Application Programming Interfaces to GAMS

Outlook - Some Advanced GAMS Features

Calling GAMS from your Application

Creating Input for GAMS Model

→ Data handling using **GDX** API

Callout to GAMS

→ GAMS option settings using **Option** API

→ Starting GAMS using **GAMS** API

Reading Solution from GAMS Model

→ Data handling using **GDX** API

Low level APIs → Object Oriented API

- Low level APIs
 - GDX, OPT, GAMSX, GMO, ...
 - High performance and flexibility
 - Automatically generated imperative APIs for several languages (C, Delphi, Java, Python, C#, ...)
- Object Oriented GAMS API
 - Additional layer on top of the low level APIs
 - Object Oriented
 - Written by hand to meet the specific requirements of different Object Oriented languages

Transport Application GUI Example

- Scenario solves of the transportation problem
- Features:
 - Preparation of input data
 - Loading data from Access file
 - Solving multiple scenarios of a model
 - Displaying results
- Four implementation steps:
 1. Graphical User Interface
 2. Preparation of GAMS model
 3. Implementation of scenario solving using GAMSJob
 4. GAMSModelInstance for performance improvements

Transport Application GUI Example

GAMS - Hands On Examples

APIs - Application Programming Interfaces to GAMS

Outlook - Some Advanced GAMS Features

Solverlink Option

controls GAMS function when linking to solve

```
Model transport /all/ ;
```

```
Option solverlink = { %Solverlink.ChainScript%,  
                      %Solverlink.CallScript%,  
                      %Solverlink.CallModule%,  
                      %Solverlink.AsyncGrid%,  
                      %Solverlink.AsyncSimulate%,  
                      %Solverlink.LoadLibrary%};
```

```
solve transport using lp minimizing z;
```

Solverlink Option

controls GAMS function when linking to solve

```
Model transport /all/ ;
```

```
Option solverlink = {      %Solverlink.ChainScript%,  
                           %Solverlink.CallScript%,  
                           %Solverlink.CallModule%,  
                           %Solverlink.AsyncGrid%,  
                           %Solverlink.AsyncSimulate%,  
                           %Solverlink.LoadLibrary%};
```

```
solve transport using lp minimizing z;
```

- ChainScript [0]: Solver process, GAMS vacates memory
 - + Maximum memory available to solver
 - + protection against solver failure (*hostile* link)
 - swap to disk

Solverlink Option – cont.

- Call{Script [1]/Module [2]}: Solver process, GAMS stays live
 - + protection against solver failure (*hostile* link)
 - + no swap of GAMS database
 - file based model communication

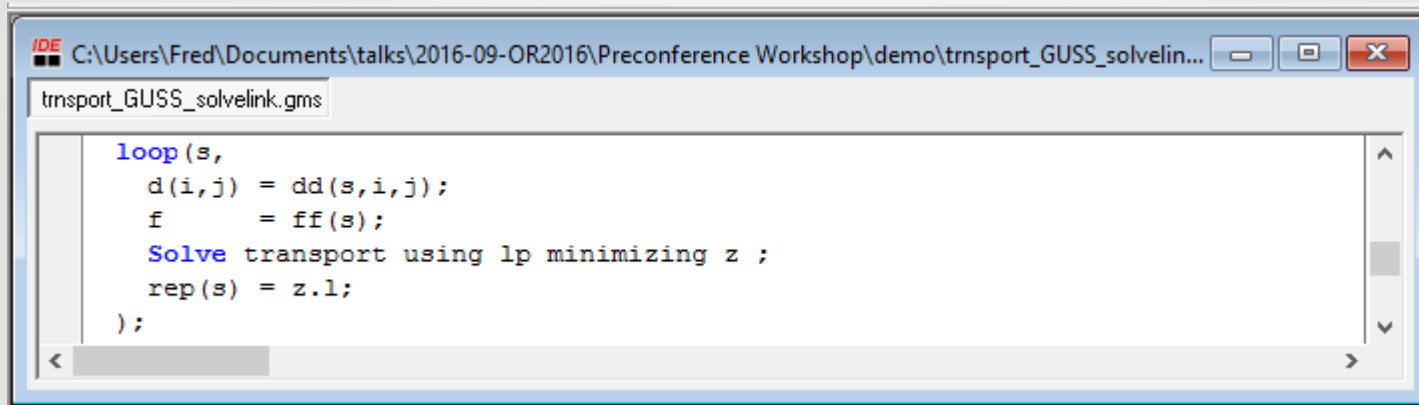

Solverlink Option – cont.

- Call{Script [1]/Module [2]}: Solver process, GAMS stays live
 - + protection against solver failure (*hostile* link)
 - + no swap of GAMS database
 - file based model communication
- LoadLibrary [5]: Solver DLL in GAMS process
 - + fast memory based model communication
 - + update of model object inside the solver (hot start)
 - not supported by all solvers

Simple Serial Solve - Performance

trnsport.gms (LP) solved 500 times with CPLEX:

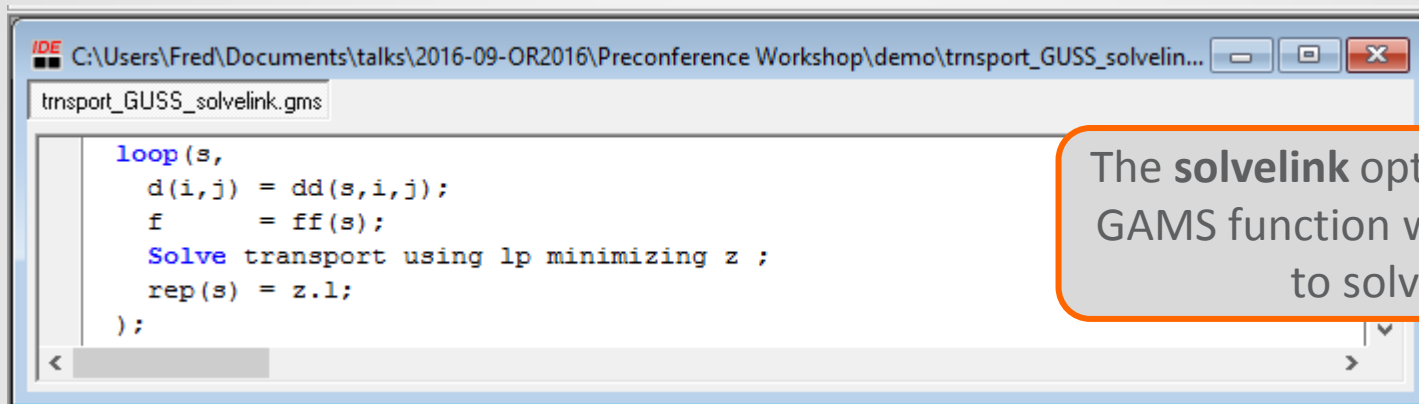

```
IDE C:\Users\Fred\Documents\talks\2016-09-OR2016\Preconference Workshop\demo\trnsport_GUSS_solvelin...
trnsport_GUSS_solvelink.gms

loop(s,
    d(i,j) = dd(s,i,j);
    f      = ff(s);
    Solve transport using lp minimizing z ;
    rep(s) = z.l;
);
```

Simple Serial Solve - Performance

trnsport.gms (LP) solved 500 times with CPLEX:

```
IDE C:\Users\Fred\Documents\talks\2016-09-OR2016\Preconference Workshop\demo\trnsport_GUSS_solvelink.gms
trnsport_GUSS_solvelink.gms

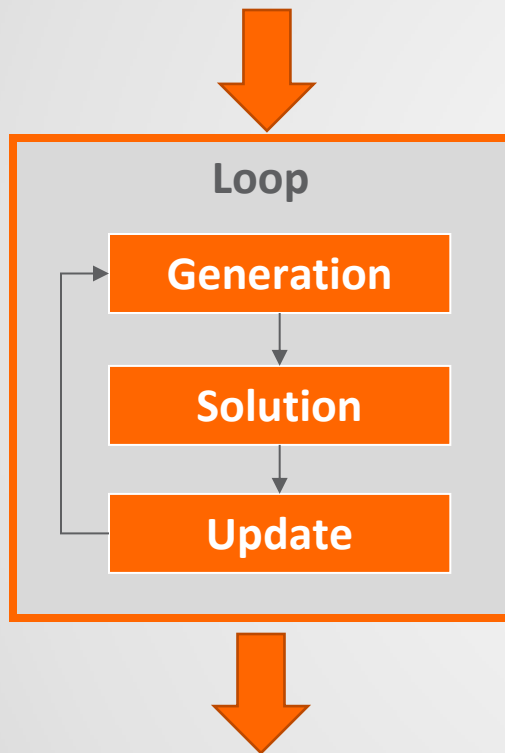

loop(s,
  d(i,j) = dd(s,i,j);
  f      = ff(s);
  Solve transport using lp minimizing z ;
  rep(s) = z.l;
);
```

The **solvelink** option controls GAMS function when linking to solve.

Setting	Solve time (secs)
Sodelink=%Sodelink.ChainScript%	54.368
Sodelink=%Sodelink.CallModule%	42.909
Sodelink=%Sodelink.LoadLibrary%	05.039

Scenario Solver

Simple Serial
Solve Loop

Scenario Solver/GUSS

Generates model once and updates the algebraic model **keeping the model “hot”** inside the solver.

Scenario Solver/GUSS - Performance

trnsport.gms (LP) solved 500 times with CPLEX:

```
* GUSS
tmp = jnow;
Set mattrib / system.GUSSModelAttributes /;
Parameter
    xxGUSS(s,i,j)    collector for level of x
    srep(s, mattrib) model attributes like modelstat etc
    o(*)              GUSS options / SkipBaseCase 1 /

Set dict / s . scenario.''
           o . opt      .srep
           d . param    .dd
           f . param    .ff
           x . level    .xxGUSS /

Solve transport using lp minimizing z scenario dict;
```

time(*): time for 500 scenarios

ChainScript	54.368
CallModule	12.909

Loop: Solvelink=%Solvelink.LoadLibrary%	2,481	
GAMS Scenario Solver	392	
CPLEX Concert Technology	210	

Grid Computing Facility

GAMS jobs in a **distributed** environment

- Scalable: supports large grids, but also works on local machine
- Platform independent, works with all solvers/model types
- Only minor changes to model required

Grid Computing Facility – Example 1

➤ GAMS Model Library: trnsgrid

```

IDE C:\Users\Fred\Documents\talks\2016-09-OR2016\Preconference Workshop\dem

Solving “many” Scenarios

How to find the right approach?

1. Small Ratio of solver time / GAMS time → Scenario Solver
2. Large ratio i.e. only solver time is relevant (pre/post processing not critical) → Grid Computing Facility
3. Entire model run including pre processing / optimization / post processing is costly → Parallel execution of entire model in the cloud

Application - Scenario Solver

➤ Scenario Solver and Parallel Combined

Implementation	Number of MIP models	Solve time	Rest of algorithm	Total time
Traditional GAMS loop	100,000	1068 sec	169 sec	1237 sec
Scenario Solver	100,000	293 sec	166 sec	459 sec

Implementation	Number of MIP models	Worker Threads	Parallel sub-problem time	Rest of algorithm (serial)	Total time
Parallel + Scenario Solver	100,000	4	116 sec	67 sec	183 sec

Where to Find Help?

- Documentation Center: <http://gams.com/help/index.jsp>
- Support Wiki: <http://support.gams.com/>
- Mailing List(s): <http://gams.com/maillist/index.htm>
- YouTube Channel: <https://www.youtube.com/user/GAMSLessons>
- GAMS support: support@gams.com

Meet us at the GAMS booth!

Other GAMS Talks

BEAM-ME: Acceleration Strategies for Energy System Models

Given by: Frederik Fiand

When: Thursday (Sep. 01), 09:00-09:30

Where: Hörsaal 3

Abstract: BEAM-ME is a project funded by the German Federal Ministry for Economic Affairs and Energy (BMWi) and addresses the need for new and improved solution approaches for energy system models. The project unites various partners with complementary expertise from the fields of algorithms, computing and application development. The considered problems result in large-scale LPs that are computationally intractable for state-of-the-art solvers. Hence, new solution approaches combining decomposition methods, algorithm development and high performance computing are developed. We provide an overview on the large variety of challenges we are facing within this project, present current solutions approaches and provide first results.

Recent Enhancements in GAMS

Given by: Franz Nelissen

When: Thursday (Sep. 01), 11:30-12:00

Where: Seminarraum 105

Abstract: Algebraic Modeling Languages (AML) are one of the success stories in Operations Research. GAMS is one of the prominent AMLs and has evolved continuously in response to user requirements, changes in computing environments and advances in the theory and practice of mathematical programming. In this talk we will begin with some fundamental principles and outline several recent enhancements of GAMS supporting efficient and productive development of optimization based decision support applications.
