

# Bruce McCarl's GAMS Newsletter Number 37

This newsletter covers

1	Updates to Expanded GAMS User Guide by McCarl et al. ....	1
2	YouTube videos .....	1
3	Explanatory text for tuple set elements .....	1
4	Reading sets using GDXXRW .....	2
4.1	Examples of data input: .....	3
4.2	Examples of data output: .....	8
4.3	Backward compatibility.....	8
5	Skipping over rows and columns in a spreadsheet.....	9
6	Courses offered.....	10
7	Unsubscribe or subscribe to future issues of this newsletter.....	10

## 1 Updates to Expanded GAMS User Guide by McCarl et al.

I updated the Expanded User's Guide to reflect the items discussed here with a few other changes. The latest can be found at <http://www.gams.com/dd/docs/bigdocs/gams2002/mccarlgamsuserguide.pdf> and will be in upcoming GAMS releases.

## 2 YouTube videos

GAMS has been making a series of tutorial videos covering various topics ranging from basic installation to more advanced data transfers. There videos are at the web page <https://www.youtube.com/user/GAMSLessons> .

Ones there as of this writing are

- A Brief Introduction to Modeling in GAMS
- Install the Windows Version of GAMS on a Mac by Using Wine
- How to Install the Native GAMS Version on a Mac
- How to Install the Native GAMS Version on Linux
- GAMS License File Installation and Component Review
- GAMS and Excel - Using GDY to Transfer Data
- Using a Solver Option File
- An Introduction to Sets in GAMS
- Where to Find Help in Using GAMS
- GAMS and Matlab GDYMRW tools RGDY and WGDY
- GAMS and Matlab GDYMRW tools IRGDY and IWGDY
- GAMS and Matlab Setup and Introduction to GDYMRW

## 3 Explanatory text for tuple set elements

I did not know until recently that one can add explanatory text to multidimensional set (tuple) elements. An example is

```

set d1 /d1,d2/
    e1 /e1,e2/
    f1 /f1,f2/
    tuplewithexp(d1,e1,f1)/
        d1.e1.f1 has text
        d2.e2.f2/

```

where the red entry is the explanatory text. This text can also come from a spreadsheet as discussed next.

#### 4 Reading sets using GDXXRW

When employing GDXXRW one can read Sets and associated explanatory text from a spreadsheet. This is partially controlled by the *Values=* option and recently that option has been altered with some changes in the behavior of the commands.

Sets may be input in two ways depending on whether to permit accommodation of duplicate entries. In output DSET and SET are the same. The syntax is

```

Set =nameofset Rng=DataRange Dimensions Values=valueoptions SymbolOptions
Dset=nameofset Rng=DataRange Dimensions SymbolOptions

```

where

Set= identifies one is to input or output set elements and optionally an associated set of element explanatory text or indicators. on input duplicates will cause read errors. When writing the element name is always written and the explanatory text will be written if the range specification permits. The keyword Set also is associated with option **values** which indicates how non zero entries in the range are to be interpreted.

Namely when data are **input** and **valueoptions** equals

**Auto** Based on the range, row and column dimensions for the set, the program decides on the value type to be used selecting from **dense** or **YN**. This is the default for Values.

when Auto or a values entry is not entered and thus the default is active then the import of data behaves differently depending on the values of rdim and cdim. Namely If

Only one of Rdim and Cdim are non zero (ie if Rdim = 0 or Cdim = 0 and the data are in vector form) then the import behaves as if

**Values=Dense**

Both Rdim and Cdim are non zero and the data are in tabular form then the import behaves as if **Values=YN**

**NoData** The data entries in the range for the set will be ignored and all entries will be included without reading explanatory text.

**YN** Only those items will be included that have a non empty data cell in the range where the cell contents that do not equal '0', 'N' or 'No'.

- Sparse** Only those items will be included that have a non empty data cell in the range. The string in the data cell will be used as the explanatory text for the set entry.
- Dense** All items will be included that are in the range regardless of whether they have entries . Any strings in the data cells in the range will be used as the explanatory text for the set elements.

For backward compatibility, the values **String** and **All** are also recognized and are synonyms to **Dense**.

However when data are **output** and the **valueoptions** equals

- Auto** Based on the range, row and column dimensions for the set, the program decides on the value type to be used selecting from **String** or **YN** . This is the default for Values.  
When Auto or a values entry is not entered and thus the default is active then the import of data behaves differently depending on the vaules of rdim and cdim. Namely If
  - Only one of Rdim and Cdim are non zero (ie if Rdim = 0 or Cdim = 0 and the data are in vector form) then the import behaves as if **Values=String**
  - Both Rdim and Cdim are non zero and the data are in tabular form then the import behaves as if **Values=YN**
- NoData** The cells in the range for the set will be blank.
- YN** Only those items will be included that have a non empty data and the cell value in the range is **Y** if the element exists.
- String** Only those items will be included that have a non empty data and the cell value in the range is **the explanatory text** if the element exists..

For backward compatibility, the values **Sparse**, **Dense**, and **All** are also recognized and are synonyms to **String**.

Dset= Reads a set of strings from a field in the spreadsheet and enters the unique ones into the set. Duplicate labels in the range specified do not generate an error message. Dset cannot be used to write to the spreadsheet. The values parameter is not used for Dset.

#### 4.1 Examples of data input:

In the input sheet of the spreadsheet we have the data for the sets to be imported

	A	B	C	D	E
1	test data for tuple input				
2		1	2	3	4
3	a	hello		no	yes
4	b		w2	y	
5	c	n		z2	
6	d	y			z
7					
8			11	12	13
9	yc	ga	aa		
10	yc	gb		ww	22
11	yd	gb		ab	ac
12					
13					
14		bd	be	bd	be
15		21	21	22	23
16	aa	aa			
17	ab		ab	ac	

and we have an index portion of the sheet (as discussed in the McCarl guide) telling us how to import with some comments added at the far right

	I	J	K	L	M	N	O	P	Q	R	S	T	U
2				rdim	cdim	values		Comment					
3	set	aa1	input!a3:a6	1	0			reads set for rows of first tuple under default					
4	set	aa1v2	input!a3:a6	1	0 yn			reads set for rows of first tuple under yn					
5	set	aa1v3	input!a3:a6	1	0 dense			reads set for rows of first tuple under dense					
6	set	aa1v4	input!a3:a6	1	0 sparse			reads set for rows of first tuple under sparse					
7	set	aa1v5	input!a3:a6	1	0 nodata			reads set for rows of first tuple under nodata					
8	set	aa1v6	input!a3:a6	1	0 auto			reads set for rows of first tuple under auto					
9	set	ab1	input!b2:e2	0	1			reads set for columns of first tuple under default					
10	set	tuple1	input!a2:e6	1	1			reads first tuple under default					
11	set	tuple1v2	input!a2:e6	1	1 yn			reads first tuple under yn					
12	set	tuple1v3	input!a2:e6	1	1 dense			reads first tuple under dense					
13	set	tuple1v4	input!a2:e6	1	1 sparse			reads first tuple under sparse					
14	set	tuple1v5	input!a2:e6	1	1 nodata			reads first tuple under nodata					
15	set	tuple1v6	input!a2:e6	1	1 auto			reads first tuple under auto					
16	dset	b1	input!b9:a11	1	0			reads sets for second three dimensional tuple first row dimension					
17	dset	b2	input!b9:b11	1	0			reads sets for second three dimensional tuple second row dimension					
18	dset	b3	input!c8:e8	0	1			reads sets for second three dimensional tuple column dimension					
19	set	tuple2	input!a8:e11	2	1			reads second three dimensional tuple under default					
20	set	tuple2v2	input!a8:e11	2	1 dense			reads second three dimensional tuple under dense					
21	set	tuple2v3	input!a8:e11	2	1 sparse			reads second three dimensional tuple under sparse					
22	dset	c1	input!a16:a17	1	0			reads sets for third three dimensional tuple row dimension					
23	dset	c2	input!b14:e14	0	1			reads sets for third three dimensional tuple first column dimension					
24	dset	c3	input!b15:e15	0	1			reads sets for third three dimensional tuple second column dimension					
25	set	tuple3	input!a14:e17	1	2			reads third three dimensional tuple under default					
26	set	tuple3v2	input!a14:e17	1	2 dense			reads third three dimensional tuple under dense					
27	set	tuple3v3	input!a14:e17	1	2 sparse			reads third three dimensional tuple under sparse					

then we import the sets in GAMS using the commands

```

$call gdxrw trytuple.xlsx o=gdxtuple.gdx index=input!i2
$gdxin gdxtuple.gdx
$load aa1,aa1v2,aa1v3,aa1v4,aa1v5,aa1v6,ab1,tuple1

```

```

$load      tuple1v2
$load      tuple1v3
$load      tuple1v4
$load      tuple1v5
$load      tuple1v6
$load      b1
$load      b2
$load      b3
$load      tuple2
$load      tuple2v2
$load      tuple2v3
$load      c1
$load      c2
$load      c3
$load      tuple3
$load      tuple3v2
$load      tuple3v3
$gdxin

```

Now let us examine some of the consequences of the value commands.

First let us look at the alternative results for importing the set in the red box below and also look at the effect of the entries in the blue box

	A	B	C	D	E
1	test data for tuple input				
2			1	2	3
3	a	hello		no	yes
4	b		w2	y	
5	c	n		z2	
6	d	y			z

When read with the values entry being **blank** (or the default - **auto** condition) the put file at the bottom of the gms file for the set aa1 shows it to contain

Defined Elements	Explanatory Text
a	hello
b	b
c	n
d	y

which shows the reading process went beyond the specified range to the adjacent column and took entries there as explanatory text leaving it blank when none was entered but in a put sense when it is empty the .tl item is entered in place of .tl. Also using **auto** and **dense** yields the same results.

When read with the values entry being **yn** we get

Defined Elements	Explanatory Text
a	a

When read with the values entry being **dense** we get

Defined Elements	Explanatory Text
a.1	hello
a.2	a.2
a.3	no
a.4	yes
b.1	b.1
b.2	w2
b.3	y
b.4	b.4
c.1	n
c.2	c.2
c.3	z2
c.4	c.4
d.1	y
d.2	d.2
d.3	d.3
d.4	z

Note here only all possible entries are defined with the non empty elements being used as explanatory text and when blank the .tl element is printed when .te is referenced.

When read with the values entry being **sparse** we get

Defined Elements	Explanatory Text
a.1	hello
a.3	no
a.4	yes
b.2	w2
b.3	y
c.1	n
c.3	z2
d.1	y
d.4	z

which defines tuple entries when there is associated text entries **including** those with **N** or **no**.

When read with the values entry being **nodata** we get

Defined Elements	Explanatory Text
a.1	a.1
a.2	a.2
a.3	a.3
a.4	a.4
b.1	b.1
b.2	b.2
b.3	b.3
b.4	b.4

c.1	c.1
c.2	c.2
c.3	c.3
c.4	c.4
d.1	d.1
d.2	d.2
d.3	d.3
d.4	d.4

Here all elements are defined as under **dense** but the **explanatory text is not read** and only element names are used when .te is referenced.

## 4.2 Examples of data output:

This was also run to output items into an output sheet from the.gdx file generated when running the input examples file telling where to place the data and what to do with explanatory text.

When putting out the set tuple1v4 with the value being **blank** or set to **yn** or set to **auto** we get

	A	B	C	D	E
35		1	2	3	4
36	a	Y		Y	Y
37	b		Y	Y	
38	c	Y		Y	
39	d	Y			Y

When putting out the set tuple1v4 with the value set to **string** we get

55		1	2	3	4
56	a	hello		no	yes
57	b		w2	y	
58	c	n		z2	
59	d	y			z

When putting out the set tuple1v4 with the value set to **nodata** we get where the range entries are blank.

75		1	2	3	4
76	a				
77	b				
78	c				
79	d				

## 4.3 Backward compatibility

When inputting sets the meanings of the commands have changed over time with the current entries not being. In particular

- Before version 24.3 the command **string** was the same as **dense** above
- Starting with 24.3 the command **string** became the same as **sparse** above

- Starting with 24.4.1 the command **all** was introduced and it functioned like **dense** above
- Starting with 24.4.6 the command structure for values became what is documented above with the option **string** redefined

With these changes GAMS broke backward compatibility. Because of this, users who employed the values option for the versions before 24.4.6. needs to review the ways their input is working and if needed either change the parameters for the GDXXRW call to the appropriate one of those described above or change the workbook data .

## 5 Skipping over rows and columns in a spreadsheet

Spreadsheet files may contain columns and rows you do not want to read.

**For blank rows or columns** the skipempty command can be used as discussed in the McCarl Guide.

**For rows or columns that you do not want to read** which have content the IgnoreColumns and IgnoreRows commands identify rows and columns to skip over. This is done using the syntax

```
IgnoreColumns=comma delimited list of spreadsheet column names
IgnoreRows=comma delimited list of spreadsheet row numbers
```

where

- The **comma delimited list of spreadsheet column names** gives the names of columns in the range to skip over and is of the form **A,C,Z,ZZ** which would cause the reading to skip the columns labeled **A,C,Z,** and **ZZ** in the Excel worksheet
- The **comma delimited list of spreadsheet row names** gives the names of rows in the range to skip over and is of the form **2,12,210** which would cause the reading to skip the rows labeled **2, 12** and **210** in the Excel worksheet

An example of using **IgnoreRows** and **IgnoreColumns** is as follows. Suppose we have a spreadsheet table that has rows and columns we do not want to read. For this we employ the skipempty sheet of the workbook **gdxxrwss.xls** that is part of the **McCarl Expanded users Guide** as in the screen shot below and skip the rows in the red boxes and the column in the blue box

	A	B	C	D	E	F	G
1							
2			ship	truck		rail	
3	brussels	cleveland	5000	0		0	
4	brussels	chicago	6000	0		0	
5	san francis	cleveland	0	2200		2200	
6							
7	san francis	chicago	0	2000		2000	
8							

and we read it using

```
$call "gdxxrw gdxxrwss.xls o=gdxignore.gdx se=0 par=moded5 mg=skipempty!a2:g69 rdim=2 cdim=1 IgnoreRows=3,5 IgnoreColumns=D"
```

then after loading into GAMS the data become

		<b>ship</b>	<b>rail</b>
<b>brussels</b>	<b>.chicago</b>	6000.000	
<b>san francisco</b>	<b>.chicago</b>		2000.000

which omits entries from those rows and columns.

**Note** The IgnoreRows and IgnoreColumns parameters appear after any parameter, set, dset etc GDXXRW command instruction and only affect reading of that item. This option will be included in the upcoming major release 24.5.

## 6 Courses offered

I will be teaching

- Basic to Advanced GAMS class Aug 10, 2015- Aug 14, 2015 (5 days) in the Colorado mountains at Frisco (near Breckenridge). The course spans from Basic topics to an Advanced GAMS class. Details are found at [http://www.gams.com/courses/basic\\_and\\_advanced.pdf](http://www.gams.com/courses/basic_and_advanced.pdf).
- Basic GAMS class Aug 10, 2015- Aug 12, 2015 (3 days) in the Colorado mountains at Frisco (near Breckenridge). The course starts assuming no GAMS background. Details are given at <http://www.gams.com/courses/basic.pdf>.
- Advanced GAMS class Aug 12, 2015- Aug 14, 2015 (3 days) in the Colorado mountains at Frisco (near Breckenridge). The course is for users who have a GAMS background. Details are found at <http://www.gams.com/courses/advanced.pdf>.

Further information and other courses are listed on <http://www.gams.com/courses.htm>. Note I also give custom courses for individual groups a couple of times a year.

## 7 Unsubscribe or subscribe to future issues of this newsletter

Please unsubscribe through the web form available at:
